low manufacturing cost. A semiconductor module is a heat-generating device and is mounted in a relatively small package. A semiconductor element is mounted on a circuit board in a semiconductor module. For heat dissipation, a heat-dissipation fin is attached to the circuit board. In order to bring the heat from the semiconductor module to the heat-dissipation fin, a semiconductor module connector is used, which has a mating portion for receiving a mating module connector. In order to prevent a fluid from leaking out of the semiconductor module connector, a seal gasket is disposed between the mating portion and the circuit board. The mating portion is usually formed of a synthetic resin. For example, Patent Literature 1 discloses a waterproof semiconductor module connector. The waterproof semiconductor module connector is disposed between a heat sink and a semiconductor module, which is a heat-generating component. The waterproof semiconductor module connector has a housing having a plurality of grooves and a metal shield. The housing has an upper cover, a lower cover, a partitioning wall and plural contact terminals. The upper cover and the lower cover are disposed inside the housing. The partitioning wall partitions an inside space of the housing into a plurality of spaces. The contact terminals are disposed on the upper cover and the lower cover, respectively. In a mating module connector, the respective contact terminals have contact portions for electrical connection.
